## **Island Care and Maintenance**

**Grout:** The grout on your island should be sealed with grout sealer at least yearly. In cold climates this process should be done more often. If repair of your grout becomes necessary; use some of the grout supplied with your island, mix it with water to the consistency of thick mud and apply to the problem area. Once applied wipe with a wet sponge.

**Tile:** Your island was shipped with a packet containing some extra tiles. If some of the tile on your island were to become damaged, remove the damaged tile with a chisel and replace it with a new tile. The new tile should be secured to the table with thin set mortar. Once the thin set is dry, reapply grout to the tile using the bag of grout supplied with the island.

**Stucco:** If any damage is done to the stucco on the island, it can be easily repaired with the bag of stucco supplied with the island. Use a flat putty knife or your finger to apply the stucco to the problem area. Once sufficient stucco is applied to fill the gap, flatten the area with the putty knife. When done re-seal the bag removing all of the air.

**Island Protection:** Protect your island from the elements by covering it when not in use, especially during the winter months. **Ice and snow can damage your island. Covering your island is essential to guarantee warranty coverage.**
